Customer Base Is Dominated by New Users

Customer Retention Remains Low

94% of Revenue Comes from New Customers

The analysis aims to answer three key questions:

how the business grows, what type of customers drive that growth, and whether it is sustainable over time.

To do this, data from orders, customers, and products has been used to build key metrics such as revenue, order volume, growth rate, and retention.

The approach is fully business-oriented, focusing not only on describing metrics but on understanding the drivers behind them.

CONTEXT AND OBJECTIVES

BUSINESS OVERVIEW (KPIs)

The business shows strong headline figures: over 13.5 million in revenue, nearly 100,000 orders, and a large customer base.

At first glance, these indicators suggest a growing and active business with solid revenue generation.

However, these KPIs alone do not reflect the quality of growth, making it necessary to analyze how these results are being achieved.

REVENUE EVOLUTION AND TREND SHIFT

Revenue shows a strong and consistent growth phase in the early stages, indicating effective customer acquisition and sales generation.

However, over time, the curve begins to flatten, losing its initial growth momentum.

This shift suggests that the model is starting to reach its limits, transitioning from expansion to a phase of relative stabilization.

Revenue Has Grown Strongly Since 2017

GROWTH ANALYSIS: FROM EXPANSION TO STABILIZATION

E-COMMERCE

The monthly growth rate confirms this pattern: after an initial period of high growth, values progressively decline. Some months even show negative or near-zero growth, indicating that the business is no longer expanding at the same pace.

This does not necessarily indicate an immediate issue, but it marks a critical point where the model needs to evolve to sustain growth.

Growth Is Slowing Down Over Time

WHAT IS ACTUALLY DRIVING THE BUSINESS

E-COMMERCE

When analyzing customer composition, it becomes clear that growth is driven almost entirely by new users.

The number of new customers increases steadily, while returning customers remain at very low levels. This indicates that the business relies heavily on continuous acquisition rather than on a strong base of loyal customers.

Customer Base Is Dominated by New Users

STRUCTURAL ISSUE: LOW CUSTOMER RETENTION

The retention rate remains around 2–3%, meaning that most customers make a single purchase and never return.

This severely limits customer lifetime value and reduces overall business efficiency.

Instead of building long-term relationships, the model functions as a constant flow of one-time users.

Customer Retention Remains Low

QUALITY OF RETURNING CUSTOMERS

Although returning customers generate higher revenue per user than new customers, their overall impact is minimal due to their low volume. Additionally, most of these customers only make one additional purchase, indicating a lack of true loyalty. This reinforces the idea that there is no strong core of repeat customers supporting the business.

BUSINESS DEPENDENCY AND REVENUE DISTRIBUTION

Over 90% of total revenue comes from new customers, highlighting an extreme dependency on acquisition.

This type of model requires constant investment in marketing and customer acquisition to maintain revenue levels.

Without improving retention, growth becomes increasingly expensive and difficult to scale

94% of Revenue Comes from New Customers

OVERALL BUSINESS DIAGNOSIS

The business has been able to grow, but it has not built a solid customer base to ensure long-term stability.

Growth is driven by volume rather than by customer quality or retention.

This creates a situation where the business appears healthy on the surface but has significant structural weaknesses.

RISKS AND SUSTAINABILITY

Dependence on new customers leads to high and continuous acquisition costs, reducing profitability. Additionally, any changes in market conditions, competition, or acquisition channels could directly impact revenue.

Without improvements in retention, the model is difficult to sustain and scale over time.

OPPORTUNITIES FOR IMPROVEMENT

The main opportunity lies in improving customer retention and increasing customer lifetime value.

Strategies such as loyalty programs, improved post-purchase experience, and re-engagement campaigns can have a strong impact.

Even small improvements in retention can lead to significantly more efficient and sustainable growth.

The analysis shows that the main issue is not the lack of growth, but the lack of retention.

The current model works, but it depends too heavily on continuous customer acquisition.

To evolve into a sustainable business, the focus must shift from growing more to retaining better.

FINAL CONCLUSION

CLOSING

The background of the slide features abstract, flowing liquid shapes in shades of blue and white against a dark background. These shapes are positioned in the top right and bottom left corners, creating a sense of movement and depth.

This project demonstrates a business-oriented approach to data analysis, where data is used to identify real problems rather than just to build visualizations.

The value lies not in the dashboard itself, but in the interpretation and decision-making based on data.

This mindset is essential for any Data Analyst role focused on delivering real business impact.
